

The new V3 Firmware in IPitomy phones has a slightly different look. You will notice that the color is now red instead of blue. The V3 firmware is an updated version that has a few minor design changes in the WEB GUI. The differences are very minor and are mostly cosmetic in nature. The most obvious difference is the Links on each page. The links now condense programming information on links inside individual web pages to provide access to relevant information in groups based upon the content.

By clicking the individual links user go to another page with all of the relevant fields for the specific programming information.

You will notice that most features have remained the same and are just rearranged on the pages for convenience.

Since IPitomy allows most programming to be accomplished from the IPitomy Web GUI, users are seldom required to use the web interface on the phone.
