

XMPP Text messaging using the Bria XMPP Client

Step 1 - Create an extension on the system. If you have set up your Bria already, use that extension and create an XMPP Account on your Accounts tab.

Step 2 - Enter you ext number as the username and PIN as the password.

Step 3 - Enter the word localhost for domain

Step 4 - Click the advanced tab

Step 5 - Enter in the IP address of the IPitomy PBX System. If you are using 3/4g you will need to use the external static IP address or Domain name. If using local wifi, you can use the inter LAN address.

It is best to set it up on the external address so it will work while outside of the building. To complete the connection, you will need to forward port 5022 to the internal IP address of the IPitomy PBX System in the Router/Firewall.

Step 7 - Assign a Qmanager Account to this extension in PBX Setup - Services

Step 8 - Log into Qmanager using the extension and pin for this extension and enable chat. After enabling the chat account you can log out of the Qmanager account for this extension.

You should now see this extension in Qmanager with the Blue text messaging icon. Your Bria should be ready to send/receive chat messages to your colleagues desktops from your mobile smart phone as well as receive presence status updates..
